### Chapter 2

### Theoretical Framework

### 2.1 Probability Concepts

Poisson process is an stochastic method that relies in the concepts of probability distributions. The main functions related to probability for extreme value analysis will be described below.

#### 2.1.1 Probability Density Function - pdf

Pdf defines the probability that a continuos variable falls between two points, this is, in *pdf* the probability is related to the area below the curve (integral) between two points, as for continuos probability distributions the probability at a single point is zero. The term density is directly related to the probability of a portion of the curve, if the density function has high values the probability will be greater in comparison with the same portion of curve for low values.

$$\int_{a}^{b} f(x)dx = Pr[a \le X \le b]$$

Equation (2.1) is the Gumbel pdf.

$$f(x) = \frac{1}{\beta} \exp\left\{-\frac{x-\mu}{\beta}\right\} \exp\left\{-\exp\left\{-\left(\frac{x-\mu}{\beta}\right)\right\}\right\}, \quad -\infty < x < \infty$$
 (2.1)

where  $\exp\{.\} \mapsto e^{\{.\}}$ ,  $\beta$  is the scale parameter, and  $\mu$  is the location parameter. Location  $(\mu)$  has the effect to shift the pdf to left or right along 'x' axis, thus, if location value is changed the effect is a movement of pdf to the left (small value for location), or to the right (big value for location). Scale has the effect to stretch  $(\beta > 1)$  of compress  $(0 < \beta < 1)$  the pdf, if scale parameter is close to zero the pdf approaches a spike.

Figure 2.1 shows pdf with location  $(\mu) = 100$  and scale  $(\beta) = 40$ , using equation (2.1).

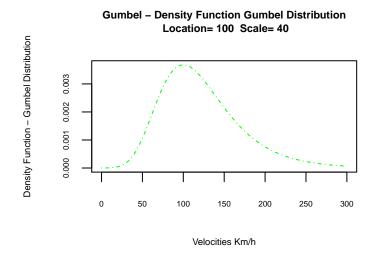

Figure 2.1: Gumbel pdf

Figure 2.2 shows pdf with location  $(\mu) = 100$  and scale  $(\beta) = 40$ , using function dgumbel of the package RcmdrMisc

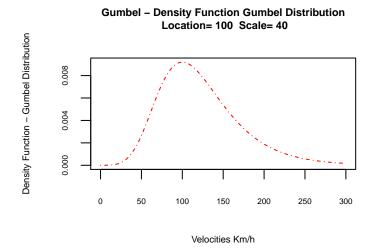

Figure 2.2: Gumbel pdf - dgumbel function

#### 2.1.2 Cumulative Distribution Function - cdf

Cdf is the probability of taking a value less than or equal to x. That is

$$F(x) = Pr[X < x] = \alpha$$

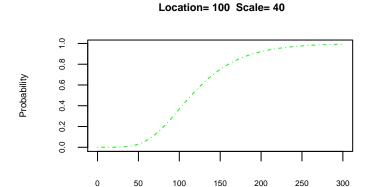

For a continuous variable, cdf can be expressed as the integral of its pdf.

$$F(x) = \int_{-\infty}^{x} f(x)dx$$

Equation (2.2) is the Gumbel cdf.

$$F(x) = \exp\left\{-\exp\left[-\left(\frac{x-\mu}{\beta}\right)\right]\right\}, \quad -\infty < x < \infty$$
 (2.2)

Figure 2.3 shows Gumbel cdf with location  $(\mu) = 100$  and scale  $(\beta) = 40$ , using equation (2.2). As previously done with pdf, similar result can be achieved using function pgumbel of package RcmdrMisc.

**Gumbel - Cumulative Distribution Function** 

#### Figure 2.3: Gumbel cdf

Velocities Km/h

#### 2.1.3 Percent Point Function - ppf

Ppf is the inverse of cdf, also called the *quantile* function. This is, from a specific probability get the corresponding value x of the variable.

$$x = G(\alpha) = G(F(x))$$

Equation (2.3) is the Gumbel ppf.

$$G(\alpha) = \mu - \beta \ln(-\ln(\alpha)) \quad 0 < \alpha < 1 \tag{2.3}$$

Figure 2.4 shows Gumbel ppf, using equation (2.3). Similar result can be achieved using function qgumbel of package RcmdrMisc.

```
location = 100
scale = 40
.x <- seq(0, 1, length.out=1000)
ppfG <- function(x) {
  location - (scale*log(-log(x)))
  }
.y = ppfG(.x)
plot(.x, .y, col="green", lty=4,
     ylab="Velocities Km/h", xlab="Probability",
     main=paste("Gumbel - Percent Point Function\n", "Location=",
     round(location,2), " Scale=", round(scale,2)), type="l",
     cex.axis = 0.5, cex.lab= 0.6, cex.main=0.7, cex.sub=0.6)</pre>
```

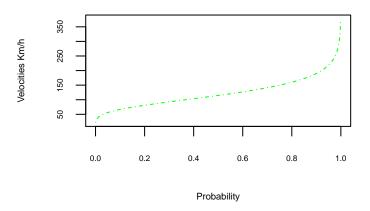

Figure 2.4: Gumbel cdf

#### 2.1.4 Hazard Function - hf

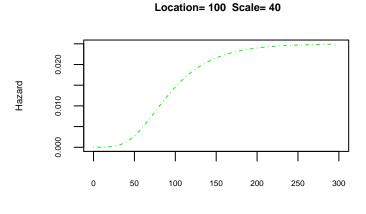

Using S(x) = 1 - F(x) as survival function -sf, the probability that a variable takes a value greather than x S(x) = Pr[X > x] = 1 - F(x), the hf is the ratio between pdf and sf.

$$h(x) = \frac{f(x)}{S(x)} = \frac{f(x)}{1 - F(x)}$$

Equation (??) is the Gumbel ppf.

Figure ?? shows Gumbel hf, using equation (??).

```
location = 100
scale = 40
.x <- seq(0, 300, length.out=1000)
hfG <- function(x) {
   (1/scale)*(exp(-(x-location)/scale))/(exp(exp(-(x-location)/scale))-1)
   }
.y = hfG(.x)
plot(.x, .y, col="green", lty=4,
        xlab="Velocities Km/h", ylab="Hazard",
        main=paste("Gumbel - Hazard Function\n", "Location=",
        round(location,2), " Scale=", round(scale,2)), type="l",
        cex.axis = 0.5, cex.lab= 0.6, cex.main=0.7, cex.sub=0.6)</pre>
```

**Gumbel - Hazard Function** 

Figure 2.5: Gumbel cdf

Velocities Km/h

#### 2.1.5 Cumulative Hazard Function

$$\sum_{j=1}^{n} (\delta \theta_{j})^{2} \leq \frac{\beta_{i}^{2}}{\delta_{i}^{2} + \rho_{i}^{2}} \left[ 2\rho_{i}^{2} + \frac{\delta_{i}^{2}\beta_{i}^{2}}{\delta_{i}^{2} + \rho_{i}^{2}} \right] \equiv \omega_{i}^{2}$$

$$\sum_{i=1}^{n} (\delta \theta_{j})^{2} \leq \frac{\beta_{i}^{2}}{\delta_{i}^{2} + \rho_{i}^{2}} \left[ 2\rho_{i}^{2} + \frac{\delta_{i}^{2}\beta_{i}^{2}}{\delta_{i}^{2} + \rho_{i}^{2}} \right] \equiv \omega_{i}^{2} \tag{2.4}$$

We can reference this combustion of glucose reaction via Equation (2.1).

$$\sum_{i=1}^{n} (\delta \theta_{i})^{2} \leq \frac{\beta_{i}^{2}}{\delta_{i}^{2} + \rho_{i}^{2}} \left[ 2\rho_{i}^{2} + \frac{\delta_{i}^{2} \beta_{i}^{2}}{\delta_{i}^{2} + \rho_{i}^{2}} \right] \equiv \omega_{i}^{2}$$

TeX is the best way to typeset mathematics. Donald Knuth designed TeX when he got frustrated at how long it was taking the typesetters to finish his book, which contained a lot of mathematics. One nice feature of *R Markdown* is its ability to read LaTeX code directly.

If you are doing a thesis that will involve lots of math, you will want to read the following section which has been commented out. If you're not going to use math, skip over or delete this next commented section.

$$\sum_{i=1}^{n} (\delta \theta_i)^2 \le \frac{\beta_i^2}{\delta_i^2 + \rho_i^2} \left[ 2\rho_i^2 + \frac{\delta_i^2 \beta_i^2}{\delta_i^2 + \rho_i^2} \right] \equiv \omega_i^2$$

From Informational Dynamics, we have the following (Dave Braden): After n such encounters the posterior density for  $\theta$  is

$$\pi(\theta|X_1 < y_1, \dots, X_n < y_n) \propto \pi(\theta) \prod_{i=1}^n \int_{-\infty}^{y_i} \exp\left(-\frac{(x-\theta)^2}{2\sigma^2}\right) dx$$

Another equation:

$$\det \begin{vmatrix} c_0 & c_1 & c_2 & \dots & c_n \\ c_1 & c_2 & c_3 & \dots & c_{n+1} \\ c_2 & c_3 & c_4 & \dots & c_{n+2} \\ \vdots & \vdots & \vdots & & \vdots \\ c_n & c_{n+1} & c_{n+2} & \dots & c_{2n} \end{vmatrix} > 0$$

Lapidus and Pindar, Numerical Solution of Partial Differential Equations in Science and Engineering. Page 54

$$\int_{t} \left\{ \sum_{j=1}^{3} T_{j} \left( \frac{d\phi_{j}}{dt} + k\phi_{j} \right) - kT_{e} \right\} w_{i}(t) dt = 0, \qquad i = 1, 2, 3.$$

L&P Galerkin method weighting functions. Page 55

$$\sum_{j=1}^{3} T_j \int_0^1 \left\{ \frac{d\phi_j}{dt} + k\phi_j \right\} \phi_i \ dt = \int_0^1 k T_e \phi_i dt, \qquad i = 1, 2, 3$$

Another L&P (p145)

$$\int_{-1}^{1} \int_{-1}^{1} \int_{-1}^{1} f(\xi, \eta, \zeta) = \sum_{k=1}^{n} \sum_{j=1}^{n} \sum_{i=1}^{n} w_{i} w_{j} w_{k} f(\xi, \eta, \zeta).$$

Another L&P (p126)

$$\int_{A_e} (\cdot) dx dy = \int_{-1}^1 \int_{-1}^1 (\cdot) \det[J] d\xi d\eta.$$

### 2.2 Annual Excedance Probability - Pa

Chemical formulas will look best if they are not italicized. Get around math mode's automatic italicizing in LaTeX by using the argument \$\mathrm{formula here}\$, with your formula inside the curly brackets. (Notice the use of the backticks here which enclose text that acts as code.)

So,  $Fe_2^{2+}Cr_2O_4$  is written  $\mathrm{mathrm}\{Fe_2^{2+}Cr_2O_4\}$ \$.

Exponent or Superscript: O<sup>-</sup>

Subscript: CH<sub>4</sub>

To stack numbers or letters as in  $Fe_2^{2+}$ , the subscript is defined first, and then the superscript is defined.

Bullet: CuCl •  $7H_2O$ 

Delta:  $\Delta$ 

Reaction Arrows:  $\longrightarrow$  or  $\xrightarrow{solution}$ 

Resonance Arrows:  $\leftrightarrow$ 

Reversible Reaction Arrows:  $\rightleftharpoons$ 

#### 2.2.1 Typesetting reactions

You may wish to put your reaction in an equation environment, which means that LaTeX will place the reaction where it fits and will number the equations for you.

$$C_6H_{12}O_6 + 6O_2 \longrightarrow 6CO_2 + 6H_2O$$
 (2.5)

We can reference this combustion of glucose reaction via Equation (2.5).

#### 2.2.2 Other examples of reactions

$$\begin{aligned} & \mathrm{NH_4Cl_{(s)}} \rightleftharpoons \mathrm{NH_{3(g)}} + \mathrm{HCl_{(g)}} \\ & \mathrm{MeCH_2Br} + \mathrm{Mg} \xrightarrow[below]{above} \mathrm{MeCH_2} \bullet \mathrm{Mg} \bullet \mathrm{Br} \end{aligned}$$

#### 2.3 Return Period

Many of the symbols you will need can be found on the math page http://web.reed.edu/cis/help/latex/math.html and the Comprehensive LaTeX Symbol Guide (http://mirror.utexas.edu/ctan/info/symbols/comprehensive/symbols-letter.pdf).

### 2.4 Compound Excedance Probability - Pn

You will probably find the resources at http://www.lecb.ncifcrf.gov/~toms/latex.html helpful, particularly the links to bsts for various journals. You may also be interested in TeXShade for nucleotide typesetting (http://homepages.uni-tuebingen.de/beitz/txe.html). Be sure to read the proceeding chapter on graphics and tables.

### 2.5 Extreme Value Analysis Overview

### Conclusion

If we don't want Conclusion to have a chapter number next to it, we can add the {-} attribute.

#### More info

And here's some other random info: the first paragraph after a chapter title or section head *shouldn't be* indented, because indents are to tell the reader that you're starting a new paragraph. Since that's obvious after a chapter or section title, proper typesetting doesn't add an indent there.

## Appendix A

# The First Appendix

This first appendix includes all of the R chunks of code that were hidden throughout the document (using the include = FALSE chunk tag) to help with readibility and/or setup.
